COFFEE FCOF 4-71 October 1971

PROCUREMENT SECTION CURRENT SERIAL RECORDS

WORLD COFFEE PRODUCTION

UP SLIGHTLY

#### Summary

The Foreign Agricultural Service now estimates the total world coffee harvest at 71.7 million bags, 1/of which approximately 52.9 million bags are expected to be available for export2/ after allowing for estimated domestic consumption in the producing countries. (This second estimate is up slightly from the first one, made in June.) Thus, it is anticipated that world production and consumption will be in approximate balance in 1971-72, following 5 consecutive years of deficit production.

Certain minor adjustments also have been made in the estimate for the 1970-71 coffee year. Total production is now forecast at 57 million bags, with exportable production estimated at about 38.9 million bags.

The greater part of the increase in the second estimate for 1971-72, compared with the earlier one, stems from upward revisions in the forecasts for Mexico and Central America. It appears that the coincidence of the "up" year in the production cycle and exceptionally favorable weather conditions in these countries thus far has greatly enhanced crop prospects. The harvest period in this area extends from about October to February.

<sup>1/</sup> All bags in text are 60 kg. (132.276 lb.).

<sup>2/</sup> Exportable production is total production less estimated domestic consumption.

<sup>1/</sup> Coffee marketing year begins about July in some countries and in others about October. 2/ Of 60 kilograms each. 3/ As indicated in footnote 1, the coffee marketing year begins in some countries as early as July. Ecuador is one of these countries. Hence, the crop harvested principally during June-October 1971 in that country is shown as production for the 1971-72 marketing year. In Ecuador, however, this is referred to as the 1970-71 crop.

Note: Production estimates for some countries include cross-border movements.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source materials, reports of U.S. Agricultural Attaches and Foreign Service Officers, results of office research, and related information.

1/ Coffee marketing year begins about July in some countries and in others about October. Exportable production represents total harvested production minus estimated domestic consumption. 2/ Of 60 kilograms each. 3/ Negligible. 4/ As indicated in footnote 1, the coffee marketing year begins in some countries as early as July. Ecuador is one of these countries. Hence, the crop harvested principally during June-October 1971 in that country is shown as production for the 1971-72 marketing year. In Ecuador, however, this is referred to as the 1970-71 crop.

Note: Production estimates for some countries include cross-border movements.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source materials, reports of U.S. Agricultural Attaches and Foreign Service Officers, results of office research, and related information.

The International Coffee Council concluded its annual meeting on Aug. 30, 1971, with the adoption of a global quota for the coffee year beginning Oct. 1, 1971, of 47 million bags. Provision was made for pro-rata adjustments, up or down, tied to the composite price level. In addition, the selectivity system to permit quota adjustments by types was retained, though with sharply lower price ranges than those in effect during the current (1970-71) coffee year. The overall spread between the floor for Robustas, the lowest-priced types, and the ceiling for Colombian Milds, the highest-priced, was reduced for the 1971-72 year, reflecting the relatively stronger position of Robustas in the world coffee market during the past year. Also in recognition of this was the fact that for the first time the price range for Robustas overlapped with that of Unwashed Arabicas (mainly Brazils).

#### Production

North America. Favorable weather conditions in most countries, the cumulative effects of improved technology and increased fertilization, and the fact that 1971-72 represents the high year in the biennial production cycle, are the major factors contributing to the record high level of production anticipated in the North American and Caribbean countries. In Central America, particularly, rainfall has been adequate but without the heavy, prolonged rains which have in the past led to fungus and other disease problems. Overall, North American production is up about 7 percent over last year.

The coming harvest in <u>Costa Rica</u> should be up about 6 percent compared with the 1970-71 crop, and the government's action to terminate the school year at an earlier date should ensure a larger labor supply for the harvest season.

It is now estimated that production in <u>Nicaragua</u> will at least equal that of last year. Nicaraguan production will probably begin to trend upward during the next few years as a result of increasing use of fertilizers and improved technology.

The combined effects of better insect and disease control, the coming into production of areas replanted with more productive varieties, and good weather point to a 1971-72 coffee harvest in Guatemala of about 2 million bags. This would be close to the record level of production achieved in 1965-66.

Estimates from El Salvador are not yet firm but it seems likely that the 1971-72 crop will be substantially larger than last year's, as in most of the Central American area.

Coffee production in <u>Mexico</u> in 1971-72 will probably be up about 10 percent over last year's frost-damaged crop, to about 3.3 million bags. Earlier fears of possible drought damage did not materialize.

South America. There have been no changes in the production estimates for the South American coffee producing countries since the first estimate by FAS in June. As noted at that time, good harvest prospects are the rule, though the major portion of the expected increase in production in 1971-72 stems from sharply increased output in Brazil.

With most of the 1971-72 crop in Brazil now harvested, it seems likely that the earlier forecast of 23.6 million bags will be confirmed. However, knowledgeable observers continue to estimate the crop in a range from 20 million to 26 million bags, so that subsequent revisions in the present estimates are not excluded. Unseasonal and persistent rains during the past few months have caused the fall of a significant amount of ripe coffee. Although most of this will be picked up from the ground, quality will suffer. Latest figures indicate that the coffee rust disease (Hemileia vastatrix) has now affected a total of about 3.5 million trees in the State of São Paulo. Although no outbreaks of rust have yet been reported from the State of Parana, Brazilian Coffee Institute (IBC) officials are concerned that the disease may soon reach that area.

Another soluble coffee plant was inaugurated during the quarter, giving Brazil an installed capacity at this time of slightly more than 2 million bags per year (green bean equivalent). Three more projected plants which have received governmental approval will, when completed, increase capacity by an additional 700,000 bags of green coffee per year.

Information regarding coffee production in <u>Colombia</u> is still tentative, but taking into consideration that 1971-72 should be the "up" year in the production cycle, a figure of about 7.8 million bags seems reasonable.

Recent reports from Peru tend to confirm the earlier estimate for 1971-72 of slightly more than 1 million bags.

Africa. Minor adjustments in the 1970-71 estimates, based on more recent information, and some slight modifications in the estimates for the 1971-72 harvest now indicate that the forthcoming crop on the African continent will be about 1 percent larger than that of 1970-71. This is in line with the trend of recent years.

Ivory Coast production for 1971-72 is estimated at this time to be about the same as last year, i.e., 4 million bags, though estimates from different sources show more than the usual variation.

Based on more complete information, previous production estimates for Uganda have been revised upward for 1969-70; down somewhat for 1970-71; and slightly higher for 1971-72. The decline in 1970-71 is attributed to drought which also may affect the 1971-72 crop.

Estimates of coffee production in <u>Kenya</u> for both 1970-71 and 1971-72 have been increased in the light of recent information from that country. With losses from CBD (Coffee Berry Disease) greatly reduced in recent years, a new and higher level of production has been attained. One adverse consequence of this, however, is a new problem of storage capacity facing the industry, as well as the need to seek markets for Kenyan coffee in the nonquota area.

Asia and Oceania. The most significant change for any country in this geographic area is the substantial revision in the coffee production estimate for India, for the year 1970-71. Recent reports indicate that a combination of higher per-acre yields, particularly in newly planted areas, and exceptionally favorable weather conditions resulted in a record crop of about 1.8 million bags. The prospective 1971-72 harvest will be much less and is currently estimated at about 1.3 million bags.

It now appears that production in the <u>Philippines</u> has been somewhat higher during the past couple of years than previously was estimated. In 1970-71 production probably reached 840,000 bags, and a small quantity of coffee was exported. These were the first such exports in more than 10 years.

#### Trade

United States. During the first 6 months of 1971 imports of green coffee amounted to 10.7 million bags, up slightly from the 10.5 million bags imported in the same period of 1970.

Imports from Brazil amounted to only 23.4 percent of the total, reflecting a continuation of the downward trend in green coffee imports from that country. Other Latin American countries obtained a 38.1 percent share of the U.S. market. Shipments from Africa were 32.5 percent of the total, and countries in Asia and Oceania supplied 6 percent.

Soluble coffee imports into the United States increased during the first half of 1971 to 402,037 bags (green bean equivalent), up 25.6 percent over imports for the first 6 months of 1970. Brazil retained its position as No. 1 supplier, with shipments of 196,287 bags (green bean equivalent). The United Kingdom and Switzerland also were important suppliers, shipping approximately 39,000 bags each during the period.

In contrast to imports, U.S. roastings of green coffee during January-June declined to 9.9 million bags, compared to 10.5 million bags during the first 6 months of 1970. These figures include roastings for soluble use. As a result, inventories, which had declined sharply in the second half of 1970, increased from 2.6 million bags on Dec. 31, 1970, to 3.1 million bags as of June 30, 1971. Stocks continued to increase during the July-September quarter as importers sought to build reserves against the possibility of a dock strike. A dock strike at the East and Gulf Coast ports did take place on Oct. 1. The West Coast dock strike, which began on July 1, was still not settled at that time.

Europe. According to a trade report from Le Havre, European imports of green coffee in 1970 reached a new alltime high of slightly more than 27 million bags, up about 1 percent from 1969. It was Robustas, however, that fared best, increasing their sales from 7.1 million bags in 1969 to 7.6 million bags in 1970. Producers of Arabica, meanwhile, saw their share of the market decline.

For the first time, also, imports of soluble coffee processed in coffee growing countries increased significantly. Soluble imports amounted to over 500,000 bags (green bean equivalent) in 1970, twice the volume of 1969.

#### International Coffee Council Actions.

The annual meeting of the International Coffee Council (ICC) in London, scheduled for Aug. 16-27, 1971, was finally brought to a successful conclusion on Aug. 30, with the adoption of a global quota of 47 million bags for the coffee year 1971-72, commencing on Oct. 1. At only 47 million bags, the quota was substantially smaller than the final quota in effect for the current year-49.5 million bags-or the final quota for the 1969-70 coffee year, which was about 52 million bags. In fact, if it remains at the initial level throughout the coming year it would be the smallest quota since 1966-67.

Despite the tightness of this initial quota, it is believed that the provisions made for quota adjustments will ensure that sufficient quantities of coffee will be available to consuming countries. This is particularly true in view of the probable drawdown of large inventories accumulated in the United States in anticipation of a dock strike. Furthermore, the steady decline in U.S. consumption of coffee, which has characterized recent years, has apparently not yet been halted.

Should the price of coffee increase beyond levels established by the ICC, measures were agreed upon which would provide for pro rata and selectivity adjustments in the quotas on essentially the same basis as for 1970-71. The price ranges established, however, were considerably below those prevailing for the current coffee year. Three increases of 1 million bags each, to be distributed pro rata, are to take effect when, and if, the composite price exceeds 45 cents, 46.25 cents, and 47.50 cents per pound. The quota would be reduced, pro rata, by 1 million bags if the composite price falls to 42.75 cents per pound, with further reductions of 1.5 million bags each when, and if, the composite price reaches 42 cents and 41 cents per pound. In each instance the composite price must remain at or below the trigger price level over a period of 15 consecutive marketing days. The composite price on Sept. 8 was 43.59 cents per pound.

In addition to the possible changes noted above, the selectivity system, to permit quota adjustments by types, also was retained, though with sharply lower price ranges than those in effect during the current 1970-71 coffee year. The overall spread between the floor for Robustas and the ceiling for Colombian Milds was substantially reduced for the 1971-72 year, reflecting the relatively stronger position of Robustas in the world coffee market during the past year. Also, for the first time, the price range for Robustas overlapped with that of Unwashed Arabicas (mainly Brazils). Heretofore, there has been a spread between the ceiling for Robustas and the floor for Unwashed Arabicas.
